Create two arrays, one to store the indices of red pegs and another to store the indices of white pegs.

For each peg in the guess:
If the peg is in the secret
code and in the same position,
add the index to the red pegs
array.

If the peg is in the secret code but not in the same position, add the index to the white pegs array.

Remove the indices from the white pegs array if they have already been added to the red pegs array.

Return the reply in the format of "x red, y white", where x is the number of red pegs and y is the number of white pegs.
